PROJECTS

- **Private Movie, Self-Hosted Streaming Platform** Live | GitHub
 - *Elysia/Bun, Drizzle, PostgreSQL, TanStack, Kotlin*
 - Built a family streaming platform end-to-end (backend API, public web, web admin, and native Android TV app) because TV streaming meant extra subscription costs and browser playback on TV had poor UX.
 - Engineered a proxy layer on a VPS that intercepts embedded-player scripts and strips ad-click mechanisms before the player reaches the viewer.
 - Deployed to a VPS under a custom domain, with my family as daily users and beta testers.
- **Monorepo Starter, Production-Ready Full-Stack Template** GitHub
 - *Elysia/Bun, Drizzle, PostgreSQL, TanStack Router, React, Zod*
 - Designed a public monorepo template using a Deep Modules structure and shared Zod contracts between the API and the frontend, applying principles from *The Pragmatic Programmer*.
 - Included an authentication module (register, login, logout, token refresh) backed by a three-tier testing strategy.
 - Used as the foundation for my own projects, including Private Movie.
- **pylearn, Learning Management System for Academic Research** May 2026
 - *Elysia/Bun, Prisma, PostgreSQL, Next.js*
 - Built a full-stack LMS solo in 2–3 weeks for a lecturer’s research, where admins create learning materials and quizzes and students read and complete them.
 - Deployed to a VPS and ran a user test with about 10 participants.

EXPERIENCE

- **PT Marstech Global** Oct. 2025 – Jan. 2026
 - *Full-Stack Developer Intern (Team Lead)*
 - Led a team of 4 interns to build an internal HR payroll system with Next.js, Express, and TypeScript, owning delivery from API development to deployment.
 - Built the login system, role-based access control (RBAC), and office and position management modules, exposing 10+ REST API endpoints.
 - Deployed the application to Railway and maintained quality through unit and integration tests and GitHub pull-request reviews.
- **Faculty Academic System, Engineering Faculty** May 2025 – Present
 - *Full-Stack Developer, Student Development Team*
 - Built the CPL and CPMK (learning outcomes) CRUD modules and the CPL–CPMK mapping API with Fastify and PostgreSQL, plus the Next.js frontend.
 - Collaborated through GitHub pull requests in a shared repository on a production system used by 200+ engineering students.
- **Village Administration System** Jul. 2025
 - *Freelance Full-Stack Developer*
 - Built a Laravel and React web system solo in one month, letting residents request 5+ types of administrative letters (birth, death, and others) online through a public form with no login.
 - Generated each letter as a PDF and gave administrators a login-protected admin panel to process requests, replacing manual typing.
 - Chose Laravel on low-cost PHP hosting to fit the village’s budget, then handed the system over to the village government.

EDUCATION

- **Universitas Muhammadiyah Ponorogo** Ponorogo, Indonesia
 - *Bachelor of Informatics Engineering (Teknik Informatika); GPA: 3.7 / 4.00* Nov. 2022 – Dec. 2026

SKILLS

Languages: TypeScript, JavaScript, SQL
Frontend: React, Next.js, TanStack Router
Backend: Elysia, Bun, Express, Fastify
Database & ORM: PostgreSQL, Drizzle, Prisma
Tools & Deployment: Git/GitHub, Railway, VPS
